INTERIM RECOMMENDATIONS FOR COADMINISTRATION OF COVID-19 VACCINE AND TUBERCULOSIS TESTING PRODUCTS

Dear Adult Family Home Provider:

Currently, tuberculosis (TB) testing requirements under WACs 388-76-10265, -10285, and 10290(1) are suspended by the Department of Social and Health Services under [WSR 20-24-060](#) due to lack of available testing statewide. However, we are aware that testing is becoming more available and you may be considering testing staff now. If you decide to test staff for TB, the Centers for Disease Control and Prevention (CDC) has published guidelines for timing TB testing and COVID-19 vaccination.

The CDC published "Interim Clinical Considerations for Use of mRNA COVID-19 Vaccines Currently Authorized in the United States." The information is located here: <https://www.cdc.gov/vaccines/covid-19/info-by-product/clinical-considerations.html>. Under the section titled "Laboratory Reporting," the CDC provided recommendations about the timing of the administration of the mRNA COVID-19 vaccine and Tuberculosis (TB) testing products.

For either a Tuberculin Skin Test (TST) or an interferon gamma release assay (IGRA) test, the CDC recommends placing the tests prior to administering COVID-19 vaccine. If vaccine was already administered or a decision is made that receiving the vaccine is a greater priority than TB testing, the CDC recommends waiting until four weeks after the two-step COVID-19 vaccination process is completed before administering the TB test. The CDC also recommends

- Performing TB symptom screening on all healthcare personnel or residents, and
- All potential recipients of COVID-19 vaccination weigh the risks and benefits of delaying TST/IGRA with their providers.

Thank you for your continued commitment to resident health and safety. If you have any questions, please contact Libby Wagner, AFH Policy Program Manager, at 253.234.6061 or Elizabeth.Wagner@dshs.wa.gov.

Sincerely,

Mike Anbesse, Director
Residential Care Services
